

# CERTIFICATION

**AOAC® *Performance Tested*™**

Certificate No.

**101801**

The AOAC Research Institute hereby certifies the test kit known as:

**Solus One *Salmonella***

manufactured by

**Solus Scientific Ltd.**

**Unit 9 Mansfield Network Centre**

**Millennium Business Park**

**Concorde Way, Mansfield**

**Nottinghamshire, NG9 7JZ**

This method has been evaluated in the AOAC® *Performance Tested Methods*™ Program and found to perform as stated by the manufacturer contingent to the comments contained in the manuscript. This certificate means that an AOAC® Certification Mark License Agreement has been executed which authorizes the manufacturer to display the AOAC *Performance Tested*™ certification mark along with the statement - "THIS METHOD'S PERFORMANCE WAS REVIEWED BY AOAC RESEARCH INSTITUTE AND WAS FOUND TO PERFORM TO THE MANUFACTURER'S SPECIFICATIONS" - on the above mentioned method for a period of one calendar year from the date of this certificate (January 17, 2020 – December 31, 2020). Renewal may be granted at the end of one year under the rules stated in the licensing agreement.

*Scott Coates*

Matrix extension to include (375 g) honey mustard seasoning and flavored ranch seasoning, (25 g) cinnamon powder, paprika powder, whole black peppercorns 2. Matrix extension to include 375 g samples of cocoa powder, cocoa liquor, milk chocolate bar	
Under this AOAC® <i>Performance Tested</i> <sup>SM</sup> License Number, 101801 this method is distributed by: NONE	Under this AOAC® <i>Performance Tested</i> <sup>SM</sup> License Number, 101801 this method is distributed as: NONE	

**PRINCIPLE OF THE METHOD (1)**

Solus One *Salmonella* is an antibody-based high sensitivity ELISA method paired with media and our proprietary media supplement – Solus One *Salmonella* supplement; for the rapid and specific detection of *Salmonella* species in select foods and environmental samples. Solus One *Salmonella* relies on antibodies attached to the wells of microplate strips by non-covalent biological interactions that are highly specific to *Salmonella* antigens. Samples are heat treated and an aliquot is added to the antibody coated wells.

*Salmonella* specific antigens present in the samples will bind immunologically to the antibody. After washing to remove unbound material, an enzyme-labelled antibody will bind to the captured proteins and thus to the well. After a second wash step to remove any unbound enzyme-antibody, the enzyme substrate is added. The substrate reacts in the presence of the enzyme producing a blue color change in the sample well. The substrate reaction is stopped after 30 minutes with the addition of dilute sulfuric acid changing any blue color present in the wells to yellow (4). Optical densities resulting from this color change are read within 10 minutes in a generic plate reader using a 450 nm filter (e.g. a microplate reader or a Dynex DS2 instrument plate reader), where a result of an OD<sub>450</sub> < 0.200 is considered to be negative for the target pathogen and OD<sub>450</sub> ≥ 0.200 is considered to be positive for the target pathogen.

**DISCUSSION OF THE VALIDATION STUDY (1)**

Solus One *Salmonella* methods successfully recovered *Salmonella* species from select food matrices and environmental surface analyzed. Using POD analysis, no statistically significant differences were observed between the number of positive samples detected by the candidate methods (both manual and automated) and the respective reference methods, BAM Ch. 5 and MLG 4.09, for food matrices and environmental surfaces tested.

POD analysis of Solus One *Salmonella* method Robustness indicated no statistically significant differences were observed between nominal and experimental combinations using the automated method.

POD analysis of Solus One *Salmonella* method Product consistency (lot-to-lot) and Stability using the automated method, indicated no statistically significant differences were observed between the lots of Solus One *Salmonella* test kits at neat and diluted *Salmonella* cultures at the LOD<sub>50</sub> of the method.

The results of the inclusivity and exclusivity evaluation demonstrated 100% agreement with expected results for the test panels and confirmed the high specificity and selectivity of the method to *Salmonella* species.

The method offers the benefit of the use of either a manual sample preparation or automated sample preparation to obtain results. Each method was quick and simple to perform, providing results in 2 h post incubation of the selective enrichment. The small footprint of both methods offers the ability to test in various laboratories. The Dynex DS2 software is user friendly with the ability to track lot information and sample identification quickly and with ease. Additionally, the Dynex DS2 software and instrument also offer the ability to run multiple assays at one time and has an open platform. With the ability to conduct a direct streak from the primary enrichment, a secondary enrichment is eliminated thereby eliminating a day until a confirmed result can be obtained.

**DISCUSSION MODIFICATION AUGUST 2019 (10)**

Solus One *Salmonella* methods successfully recovered *Salmonella* species from spice and flavor blend matrices analyzed. Using POD analysis, no statistically significant differences were observed between the number of positive samples detected by the candidate method and the FDA/BAM Ch. 5 reference method, for food matrices tested.

The results of the inclusivity and exclusivity evaluation with Solus mBPW supplemented with 2.22 mL Solus One *Salmonella* supplement per 1.0 L medium, demonstrated 100% agreement with expected results for the test panels and confirmed the high specificity and selectivity of the method to *Salmonella* species. The method offers the benefit of the use of either a manual sample preparation or automated sample preparation to obtain results. Each method was quick and simple to perform, providing results in 2 h post incubation of the selective enrichment. The small footprint of both methods offers the ability to test in various laboratories. The Dynex DS2 software is user friendly with the ability to track lot information and sample identification quickly and with ease. Additionally, the Dynex DS2 software and instrument also offer the ability to run multiple assays at one time and has an open platform. With the ability to conduct a direct streak from the primary enrichment, a secondary enrichment is eliminated thereby eliminating a day until a confirmed result can be obtained.

This method modification recovered and detected *Salmonella* species from difficult spice and flavor blend matrices within a 24 h primary enrichment through an enhanced system comprising of additional neutralization properties of the Solus mBPW medium, enhanced selective properties of the Solus One *Salmonella* supplement and a sensitive Solus One *Salmonella* ELISA immunoassay method.

#### DISCUSSION MODIFICATION JANUARY 2020 (11)

The Solus One *Salmonella* ELISA assay successfully detected *Salmonella* species from cocoa powder, cocoa liquor, and milk chocolate bar. Using POD analysis, no statistically significant differences were observed between the number of positive samples detected by the reference methods and the Solus One *Salmonella* ELISA assay.

The method offers the benefit to the use of either a manual or automated preparation to obtain results. Each method is quick and simple to perform, providing results in almost 2 hours post incubation of the enrichment. The small footprint of both methods offers the ability to test in various laboratories. The Solus One *Salmonella* ELISA assay detected *Salmonella* spp. within a 20 hour primary enrichment.
